What can go wrong

BIG DATA

The Parable of Google Flu: Traps in Big Data Analysis

David Lazer, 1,2* Ryan Kennedy, 1,3,4 Gary King, 3 Alessandro Vespignani 5,6,3

n February 2013, Google Flu Trends (GFT) made headlines but not for a reason that Google executives or the creators of the flu tracking system would have hoped. Nature reported that GFT was predicting more than double the proportion of doctor visits for influenza-like illness (ILI) than the Centers for Disease Control and Prevention (CDC), which bases its estimates on surveillance reports from laboratories across the United States (1, 2). This happened despite the fact that GFT was built to predict CDC reports. Given that GFT is often held up as an exemplary use of big data (3, 4), what lessons can we draw from this error?

The problems we identify are not limited to GFT. Research on whether search or social media can

Large errors in flu prediction were largely avoidable, which offers lessons for the use of big data.

run ever since, with a few changes announced in October 2013 (10, 15).

Although not widely reported until 2013, the new GFT has been persistently overestimating flu prevalence for a much longer time. GFT also missed by a very large margin in the 2011-2012 flu season and has missed high for 100 out of 108 weeks starting with August 2011 (see the graph). These errors are not randomly distributed. For example, last week's errors predict this week's errors (temporal autocorrelation), and the direction and magnitude of error varies with the time of year (seasonality). These patterns mean that GFT overlooks considerable information that could be extracted by traditional statistical methods.

Components of a predictor

question -> input data -> features -> algorithm -> parameters -> evaluation

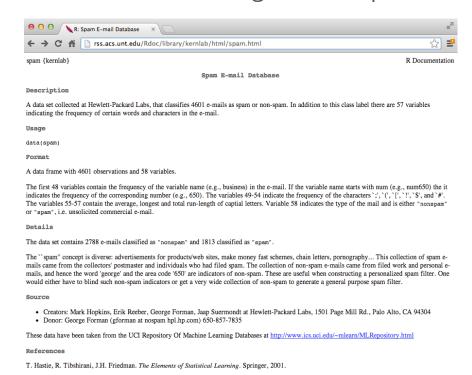

Start with a general question

Can I automatically detect emails that are SPAM that are not?

Make it concrete

Can I use quantitative characteristics of the emails to classify them as SPAM/HAM?

question -> input data -> features -> algorithm -> parameters -> evaluation

http://rss.acs.unt.edu/Rdoc/library/kernlab/html/spam.html

question -> input data -> features -> algorithm -> parameters -> evaluation

Dear Jeff,

Can you send me your address so I can send you the invitation?

Thanks,

Ben

question -> input data -> features -> algorithm -> parameters -> evaluation

Dear Jeff,

Can you send me your address so I can send you the invitation?

Thanks,

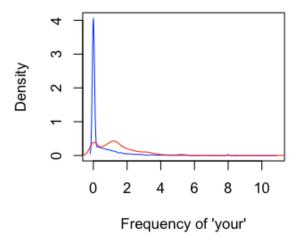

Ben
