

# Debugging

Roger D. Peng, Associate Professor of Biostatistics Johns Hopkins Bloomberg School of Public Health

Indications that something's not right

- message: A generic notification/diagnostic message produced by the message function;
   execution of the function continues
- warning: An indication that something is wrong but not necessarily fatal; execution of the function continues; generated by the warning function
- error: An indication that a fatal problem has occurred; execution stops; produced by the stop function
- condition: A generic concept for indicating that something unexpected can occur; programmers can create their own conditions

#### Warning

```
log(-1)

## Warning: NaNs produced

## [1] NaN
```

```
printmessage <- function(x) {
    if(x > 0)
        print("x is greater than zero")
    else
        print("x is less than or equal to zero")
    invisible(x)
}
```

```
printmessage <- function(x) {
   if (x > 0)
      print("x is greater than zero") else print("x is less than or equal to zero")
   invisible(x)
}
printmessage(1)
```

```
## [1] "x is greater than zero"
```

```
printmessage(NA)
```

```
## Error: missing value where TRUE/FALSE needed
```

```
printmessage2 <- function(x) {
    if (is.na(x))
        print("x is a missing value!") else if (x > 0)
        print("x is greater than zero") else print("x is less than or equal to zero")
        invisible(x)
}
x <- log(-1)</pre>
```

```
## Warning: NaNs produced
```

```
printmessage2(x)
```

```
## [1] "x is a missing value!"
```

How do you know that something is wrong with your function?

- What was your input? How did you call the function?
- What were you expecting? Output, messages, other results?
- What did you get?
- How does what you get differ from what you were expecting?
- Were your expectations correct in the first place?
- · Can you reproduce the problem (exactly)?

#### **Debugging Tools in R**

The primary tools for debugging functions in R are

- traceback: prints out the function call stack after an error occurs; does nothing if there's no error
- debug: flags a function for "debug" mode which allows you to step through execution of a function one line at a time
- browser: suspends the execution of a function wherever it is called and puts the function in debug mode
- trace: allows you to insert debugging code into a function a specific places
- recover: allows you to modify the error behavior so that you can browse the function call stack

These are interactive tools specifically designed to allow you to pick through a function. There's also the more blunt technique of inserting print/cat statements in the function.

#### traceback

```
> mean(x)
Error in mean(x): object 'x' not found
> traceback()
1: mean(x)
>
```

#### traceback

```
> lm(y ~ x)
Error in eval(expr, envir, enclos) : object 'y' not found
> traceback()
7: eval(expr, envir, enclos)
6: eval(predvars, data, env)
5: model.frame.default(formula = y ~ x, drop.unused.levels = TRUE)
4: model.frame(formula = y ~ x, drop.unused.levels = TRUE)
3: eval(expr, envir, enclos)
2: eval(mf, parent.frame())
1: lm(y ~ x)
```

## debug

```
> debug(lm)
> lm(y ~ x)
debugging in: lm(y ~ x)
debug: {
    ret.x <- x
    ret.y <- y
    cl <- match.call()
    ...
    if (!qr)
        z$qr <- NULL
    z
}
Browse[2]>
```

#### debug

#### recover

```
> options(error = recover)
> read.csv("nosuchfile")
Error in file(file, "rt") : cannot open the connection
In addition: Warning message:
In file(file, "rt") :
    cannot open file 'nosuchfile': No such file or directory

Enter a frame number, or 0 to exit

1: read.csv("nosuchfile")
2: read.table(file = file, header = header, sep = sep, quote = quote, dec = 3: file(file, "rt")

Selection:
```

#### Debugging

#### Summary

- · There are three main indications of a problem/condition: message, warning, error
  - only an error is fatal
- · When analyzing a function with a problem, make sure you can reproduce the problem, clearly state your expectations and how the output differs from your expectation
- Interactive debugging tools traceback, debug, browser, trace, and recover can be used to find problematic code in functions
- Debugging tools are not a substitute for thinking!
